The Android community is sometimes hard to understand. Specifically, the group that has been rooting all over and ROMing since the beginning of Android. I was one of you, but I have to say that I didn't feel the need to mess around with my phone for a very long time. How did I move from one extreme to the other? It's a bit tricky, so let me share my experience before jumping into the poll and commentary. In the beginning... I believe this trend has followed many of us avid Android users. Here's how it seems to work... or at least that's how it was for me. Back when I bought my first Android device, the user interface (LG) was terrible and the phone was unbearably slow. I found that rooting and flashing good ROM helped with the aesthetics and convenience of users, so I took on the quest for learning how all this hacking worked. It also allowed me to clear storage space by getting rid of viruses, since then the internal storage was also a little limited, and fewer smartphones allowed you to remove these bulky pre-installed applications. And so I lived with the best user interface and cool root apps that really unlocked the potential of the phone, but that wasn't enough after a while. Mobile equipment is still in its infancy and the phones were slow (even fast). I needed more power, so I decided to flash the custom core and disperse that processor without end. Only then did we really talk about serious business. Things got serious and I got into flashing all kinds of ROM. I literally kept one rom for a week at a time. It was crazy, and something I got more very quickly. related_videos Linked Videos align the center of the type of custom video600217,413748,315684 And then there were the best phones Android phones were developing rapidly in this fast-paced market; much faster than our content can. Even in the middle end phones have started to get good handling of relatively intense games, and they handled random tasks very easily. A new era was upon us, and we soon realized that we no longer need to overclock, as this activity takes on battery losses. Some of us stopped getting sick, but others decided to actually underclock and undervolt. We are now near the end of 2015 and mobile technology is racing and bordering forward. Manufacturers have realized that the simpler the better, so that the current smartphones are really skinned off all that extra flair they liked so much. Motorola specifically stands out for this, since their software is almost as stock as you can get, while also adding some interesting features. Battery life is also being actively addressed. We have battery monsters like droid Maxx 2 and Moto X Play. Google also unveiled Doze, which saves battery by putting the phone in a deeper while inactive. LG has also tried to reduce the screen frame rate when the image is static (for example, when you look at a picture). All these methods have helped and most people can go through a full day of battery life without many obstacles (some even 2 days!). READ ALSO: The End of the End rooting and flashing OM? Things have definitely changed. Phones are fast, UIs are cleaner than ever, phones have many features, many manufacturers allow you to remove (or disable) viruses and battery life starts to become much less of a problem. Is there still a reason for you to root out your phone and install party-party software? It seems the stock is the way to go for more and more people lately. Of course, this is a very subjective issue, which is why we encourage you to see how Android Authority fans feel about it. There isn't much research on this, so we thought we should do our own little poll and get some numbers. Last time we heard, a Tencent study found that more than 27% of Android users root their phones (most of them to remove viruses, apparently). It's actually an impressive number and I wonder if it goes up or down. Even so, we want to know what our fellow Android lovers think of it! Are you still the root? If you do, what is your main reason? Maybe you feel like me and you just let your phone be, or find you can do some pretty cool settings even without the root. Let's find out how the community stands by responding to the poll below. We also know that this question is not so cut and dried, so join the conversation in the comments to expand your answer! Last updated September 28, 2020 brain confusing network information. We don't remember a single fact, but instead we are interconnected by association. Whenever we experience a new event, our brains link the sights, smells, sounds and our own experiences together into a new relationship. Our brain remembers things by repetition, association, visual images and all five senses. By knowing a little about how the brain works, we can become better learners by absorbing new information faster than ever. Here are some research tips to help you get started:1. Use Flashcards Our brains create ingrained memories through repetition. The more times we hear, see, or repeat something for ourselves, the more likely we are to remember it. Flash cards can help you learn new subjects quickly and efficiently. Flash cards allow you to learn anywhere at any time. Their portable nature gives them quick training sessions on the bus, on the move, at lunch, or in the doctor's office. You can always pop out your flash card for a quick 2 to 3 minute study session. To create effective flash cards, you need to put one point on each flash card. Don't download the entire map with information. It's just overload. Instead, you should devote one concept to each map. One of the best ways to make a flash card is to put one question on the front and one answer on your back. So you can repeatedly quiz yourself in mastered any topic of your choice. Commit to reading through flash cards at least 3 times a day and you'll be amazed at how fast you pick up new information. As Tony Robbins says: Repetition is the mother of craftsmanship. Create the right environmentOften where you study can be just as important as how you study. For an optimal learning environment, you will want to find a good place that is pretty peaceful. Some people may not stand deafening silence, but you certainly don't want to learn near constant distractions. Find a place you can call your own, with plenty of room to spread your belongings. Go there every time you study and you find yourself adapting to a productive learning schedule. Every time you study in the same place, you become more productive in this place because you associate it with your studies.3 Use acronyms to remember informationIn your quest for knowledge, you may have once heard of a strange term called mmmonics. However, even if you haven't heard of this word, you've certainly heard of its many applications. One of the most popular mnemonic examples is Every Good Boy doing well. This is an acronym used to help musicians and students memorize notes on triple stave key. An abbreviation is simply an acronym formed using the intial letters of the word. These types of memory tools can help you learn a large amount of information in a short period of time. Listen to MusicResearch has long shown that some types of music will help you remember the information. Information received while listening to a particular song can often be memorized simply by playing songs mentally in your head. 5. Rewrite your notesIt can be done manually or on your computer. However, you should keep in mind that handwritten writing can often stimulate more neural activity than when writing on a computer. Everyone should study their notes at home, but often times, just rereading them too passively. Rereading notes can cause you to disconnect and distract. To get most of your research time, make sure it is active. Rewriting notes turns passive learning time into an active and attractive learning tool. You can start using this technique by buying two laptops for each of your classes. Dedicate one of the notepads to notes during each class. Dedicate another notebook to rewriting notes outside of class.6. Participation of your emotions Emotion plays a very important role in your memory. Think about it. The last time you went to a party that people you remember? The lady who made you laugh, the man who hurt your feelings, and the guy who screamed in the hallways are the ones you remember. They were the ones who had the emotional impact. Fortunately, you can harness the power of emotion in your own training sessions. Increase your memory with five senses. Don't just remember the facts. Don't just see and hear the words in your mind. Create a vivid visual picture of what you're trying to learn. For example, if you're trying to find out part of the human cell, start physically rotating cells in your eyes minds. Imagine what each part can feel. Start taking the cell piece by piece and then reconstructing it. Paint of human cell cells bright colors. Increase the cell in your mind's eyes so that it is now six feet tall and put on your personal comedy show. This visual and emotional mind game will help

you deeply encode information into your memory7. Make AssociationsOne out of the best ways to learn new things to link what you want to learn with something you already know. It's known as association, and it's the mental glue that controls your brain. Have you ever listened to a song and were inundated with memories that were associated with it? Have you ever seen an old friend who evoked memories from childhood? That's the power of association. To maximize our mental abilities, we must constantly look for ways to connect new information with old ideas and concepts that we are already familiar with. You can do this with mindmapping. A map of the mind is used to chart words, pictures, thoughts, and ideas into an interconnected network of information. This simple practice will help you connect everything you learn into a global network of knowledge that can be learned from at any time.
